

ByeongSu Hong

Software Engineer · Seoul, South Korea

hong@byeongsu.dev · byeongsu.dev · github.com/byeongsu-hong · linkedin.com/in/byeongsu-hong

Software engineer working on distributed systems, mostly in Rust and Go. Eight years in blockchain infrastructure, from smart contracts and cross-chain bridges to validator operations and consensus. Open to backend, infrastructure, protocol and AI agent roles, in Seoul or remote.

EXPERIENCE

Co-founder · Ducktape Industries

Jul 2026 – Present

- Building a workspace where a team and its AI agents share one state: chat, a Git forge with code review, and sandboxed compute, replicated across the team's own validator network.
- Co-built its consensus and execution layers in Rust.

Protocol Engineer · Manythings, Seoul

Jan 2022 – Feb 2026

- **Mitosis**. Designed the LRT vault system (up to \$100M in initial liquidity) and core L1 components: validator staking, reward settlement, VLF vaults and hub-chain protocols. Took the contracts through external audits.
- **cw-hyperlane**. Primary author of Hyperlane's official CosmWasm implementation (multisig ISM, warp routes). Supported its external audit.
- **Hyperlane validator operations**. Built and operated high-availability validator infrastructure across 125+ chains on Kubernetes with ArgoCD and Prometheus/Grafana. Cut external RPC calls by 28% (97k to 70k a day) through batching and caching.
- **Kaizen**. Sole engineer on the alpha of a price-range prediction market: an event-sourced execution engine with parallel execution and versioned state (RocksDB + JMT), a CEX price oracle, and a TypeScript SDK.

Software Engineer · Terraform Labs, Seoul

Jan 2021 – Dec 2021

- **Anchor Protocol**. Led eth-anchor, the Ethereum bridge for Anchor Protocol (\$16B+ peak TVL).
- **Pylon Protocol**. Proposed and led Pylon, a yield redirection platform on Terra, as an internal incubation. Wrote the core CosmWasm contracts and shipped them through audit to \$200M+ peak TVL.
- **Mirror Protocol**. Built Mirror's Ethereum-side LP incentive contracts (\$100M+ in assets) and took them through audit to production.

Blockchain Engineer · AB180, Seoul

Mar 2018 – Jan 2021

- **Airbloc Protocol**. Wrote the Solidity contracts for a data-exchange protocol (100% branch coverage) and the Go and Python SDKs that replaced its P2P node. Built a Go worker that synced consent records on-chain daily.
- **Data pipeline**. Built real-time and batch data pipelines for enterprise partners and moved them from AWS Lambda to Kubernetes on EKS.

OPEN SOURCE

- **osmosis-labs/osmosis** · Built the x/gamm AMM module from scratch, 8 months before mainnet. Hackatom V winning project (Oct 2020).
- **many-things/cw-hyperlane** · Primary author of the official Hyperlane CosmWasm implementation.
- **hyperlane-xyz/hyperlane-monorepo** · Co-author of the Cosmos and CosmWasm agent integration.
- **pylon-protocol/pylon-core-contracts**, **Anchor-Protocol/eth-anchor-contracts** · Primary author.

SKILLS

Languages	Rust, Go, Solidity, TypeScript, Python
Systems	BFT consensus, state sync, CosmWasm, Cosmos SDK, EVM, Solana
Infrastructure	Kubernetes, Argo CD / Workflows, Terraform, AWS (EKS), Prometheus, Grafana

EDUCATION

Incheon National University · Electronic Engineering

2017 – 2025 · Withdrew
